COMMUNITY OF AFFILIATES AND RESOURCES EMPOWERING SOUTH FLORIDA'S TRANSGENDER COMMUNITY

Guide to MEDICAL PROFESSIONALS, CHURCHES & ORGANIZATIONS

Summer 2009

Q & A

Medical Professionals

Endocrinologists

An endocrinologist is a specially trained doctor. Endocrinologists diagnose diseases that affect your glands. They know how to treat conditions that are often complex and involve many systems within your body. Endocrinologists are trained to diagnose and treat hormone imbalances and problems by helping to restore the normal balance of hormones in your system.

Please note: Most Insurance Companies will require that your primary care doctor refer you to an endocrinologist.

LORENA LEWY-ALTERBAUM, M.D. F.A.C.E.

Endocrinology and Metabolism

3700 Washington
Hollywood, FL 33021

Telephone: (954) 967-0500

Fax: (954) 967-0778

Website: www.drlorenalewy.com

E-mail: doctor@drlorenalewy.com

NEIL GOODMAN, M.D.

Diabetes, Endocrinology & Metabolism, Internal Medicine

Location:

9150 South West 87th Avenue, Suite 210
Miami, FL 33176

Telephone: (305) 595-6855

E-mail: doctor@drlorenalewy.com

Mental Health Professionals

A mental health professional is a person who offers services for the purpose of improving an individual's mental health or to treat mental illness. This broad category includes psychiatrists, clinical psychologists, clinical social workers, psychiatric nurses, mental health counselors as well as many other professionals. These professionals often deal with the same illnesses, disorders, conditions, and issues.

HOPE WINE, PSY.D., PH.D

Clinical Psychologist

Location:

7600 S Red Rd, Ste 302
South Miami, FL 33143

Telephone: (305) 662-1199**E-mail:** drhopewine@aol.com

Internal Medicine Physicians

Internal medicine is a medical specialty which focuses on the diagnosis, treatment, and prevention of nonsurgical conditions in adults. Internal Medicine Physicians are specially trained to solve puzzling diagnostic problems and can handle severe chronic illnesses and situations where several different illnesses may strike at the same time. They also bring to patients an understanding of wellness (disease prevention and the promotion of health), women's health, substance abuse, mental health, as well as effective treatment of common problems of the eyes, ears, skin, nervous system and reproductive organs.

E-mail: doctor@drlorenalewy.com

JENNIFER BARTCZAK, MD

Infectious Disease Medicine, Internal Medicine

Office Location:

2500 North East 15th Avenue
Wilton Manors, FL 33305

Telephone: (954) 533-5382

E-mail: doctor@drlorenalewy.com

Surgeons

Surgeons are medical practitioners who perform invasive medical treatment that usually involves the cutting of the body. Surgery can last from minutes to hours, but is typically not an ongoing or periodic type of treatment. There are a variety of Surgeons who perform operations for the purpose of reconstruction of a body part for cosmetic or medically necessary reasons.

Note: Surgeons performing surgery for the purpose of transitioning to another sex will require a letter from a mental health professional authorizing such procedures.

HAROLD M. REED, M.D.

The Reed Centre for Genital and Sex
Change Surgery

Family Practice Physicians

Also known as a General Practitioner is a medical practitioner who provides primary care and specializes in family medicine. A general practitioner treats acute and chronic illnesses and provides preventive care and health education for all ages and both sexes. They have particular skills in treating people with multiple health issues.

NOAH LEE, DO

Family Practice Physician

Office Location:

2817 E Oakland Park Blvd
Wellness Medical Center, Suite 302
Fort Lauderdale, FL 33306

Telephone: (954) 533-5382

Pediatricians

Pediatricians are medical practitioners who care for children from birth to early adulthood. They specialize in diseases and ailments specific to young and growing bodies.

Medical Clinics

A Medical Clinic (or an **outpatient clinic**) is a small private or public health facility that is devoted to the care of outpatients, often in a community, in contrast to larger hospitals, which also treat inpatients. Some grow to be institutions as large as major hospitals, whilst retaining the name **clinic**. These are often associated with a hospital or medical school. General practice clinics are run by one or more general practitioners or practice managers.

TEN THINGS TRANSGENDER PERSONS SHOULD DISCUSS WITH THEIR HEALTH CARE PROVIDERS

1. Access to Health Care

Transgender persons are often reluctant to seek medical care through a traditional provider-patient relationship. Some are even turned away by providers. A doctor who refuses to treat a trans person may be acting out of fear and transphobia, or may have a religious bias against GLBT patients. It's also possible that the doctor simply doesn't have the knowledge or experience he needs. Furthermore, health care related to transgender issues is usually not covered by insurance, so it is more expensive. Whatever the reasons, transgender people have sometimes become very ill because they were afraid to visit their providers.

2. Health History

Trans persons may hide important details of their health history from their doctors. Perhaps they fear being denied care if their history is known. Even many years after surgery, they may omit the history of their transition when seeing a new provider. Patients should see their provider as an equal partner in their health care, not as a gatekeeper or an obstacle to be overcome.

3. Hormones

Cross-gender hormone therapy gives desirable feminizing (or masculinizing) effects, but carries its own unique risks. Estrogen has the potential to increase the risk of blood clotting, high blood pressure, elevated blood sugar and water retention. Anti-androgens such as spironolactone can produce dehydration, low blood pressure, and electrolyte disturbances. Testosterone, especially when given orally or in high doses, carries the risk of liver damage. Hormone use should be appropriately monitored by the patient and provider. Some trans people tend to obtain hormones and other treatment through indirect means, bypassing the health care system. Taking hormones without supervision can result in doses too high or too low, with undesired results.

4. Cardiovascular Health

Trans persons may be at increased risk for heart attack or stroke, not only from hormone use but from cigarette smoking, obesity, hypertension, and failure to monitor cardiovascular risks. Trans women may fear that a provider who finds them at risk for cardiovascular disease will instruct them to stop their hormones, and so they do not seek medical attention even when they have early warning signs of heart disease or stroke.

5. Cancer

Hormone-related cancer (breast in trans women, liver in women or men) is very rare but should be included in health screening. A greater worry is cancer of the reproductive organs. Trans men who have not had removal of the uterus, ovaries, or breasts are still at risk to develop cancer of these organs. Trans women remain at risk, although low, for cancer of the prostate. Furthermore, some providers are uncomfortable with treating such cancers in trans people. Some cases have been reported in which persons delay seeking treatment, or are refused treatment, until the cancer has spread.

6. STDs and Safe Sex

Trans people, especially youth, may be rejected by their families and find themselves homeless. They may be forced into sex work to make a living, and therefore at high risk for STDs including HIV. Other trans people may practice unsafe sex when they are beginning to experience sexuality in their desired gender. Safe sex is still possible even in transgender relationships.

7. Alcohol and Tobacco

Alcohol abuse is common in transgender people who experience family and social rejection, and the depression which accompanies such rejection. Alcohol combined with sex hormone administration increases the risk of liver damage. Tobacco use is high among all trans persons, especially those who use tobacco to maintain weight loss. Risks of heart attack and stroke are increased in persons who smoke tobacco and take estrogen or testosterone.

8. Depression/Anxiety

For many reasons, trans people are particularly prone to depression and anxiety. In addition to loss of family and friends, they face job stress and the risk of unemployment. Trans people who have not transitioned and remain in their birth gender are very prone to depression and anxiety. Suicide is a risk, both prior to transition and afterward. One of the most important aspects of the transgender therapy relationship is management of depression and/or anxiety.

9. Injectable Silicone

Some trans women want physical feminization without having to wait for the effects of estrogen. They expect injectable silicone to give them “instant curves.” The silicone, often administered at “pumping parties” by non-medical persons, may migrate in the tissues and cause disfigurement years later. It is usually not medical grade, may contain many contaminants, and is often injected using a shared needle. Hepatitis may be spread through use of such needles.

10. Fitness (Diet & Exercise)

Many trans people are sedentary and overweight. Exercise is not a priority, and they may be working long hours to support their transitions. A healthy diet and a frequent exercise routine are just as important for trans persons as for the public. Exercise prior to sex reassignment surgery will reduce a person’s operative risk and promote faster recovery.
